Assignment 7: GLMs (Linear Regressios, ANOVA, & t-tests)

Yuechen Huang

Fall 2023

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Rename this file `<FirstLast>_A07_GLMs.Rmd` (replacing `<FirstLast>` with your first and last name).
2. Change "Student Name" on line 3 (above) with your name.
3. Work through the steps, **creating code and output** that fulfill each instruction.
4. Be sure to **answer the questions** in this assignment document.
5. When you have completed the assignment, **Knit** the text and code into a single PDF file.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.

2. Build a ggplot theme and set it as your default theme.

```
#1
getwd()
```

```
## [1] "D:/ENV872_DataExploration/ENV872_DataExploration_Fall2023"
```

```
library(tidyverse)
```

```
## -- Attaching core tidyverse packages ------------------------ tidyverse 2.0.0 --
## v dplyr     1.1.3     v readr     2.1.4
## v forcats   1.0.0     v stringr   1.5.0
## v ggplot2   3.4.3     v tibble    3.2.1
## v lubridate 1.9.2     v tidyr     1.3.0
## v purrr     1.0.2
## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

```
library(agricolae)
library(here)
```

```
## here() starts at D:/ENV872_DataExploration/ENV872_DataExploration_Fall2023
```

```
NTL_raw <- read.csv(here("Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv"), stringsAsFactors = TRUE)
NTL_raw$sampledate <- as.Date(NTL_raw$sampledate, '%m/%d/%y')

#2
YH_Theme <- theme_classic(base_size = 14) +
  theme(axis.text = element_text(color = "black"),
        legend.position = "right",
        legend.text = element_text(size = 10),
        legend.title = element_text(size = 11))
theme_set(YH_Theme)
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: The mean lake temperature in July in all lakes among all depths show no difference Ha: There is difference of the mean lake temperature in July in different lakes or among different depths

4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

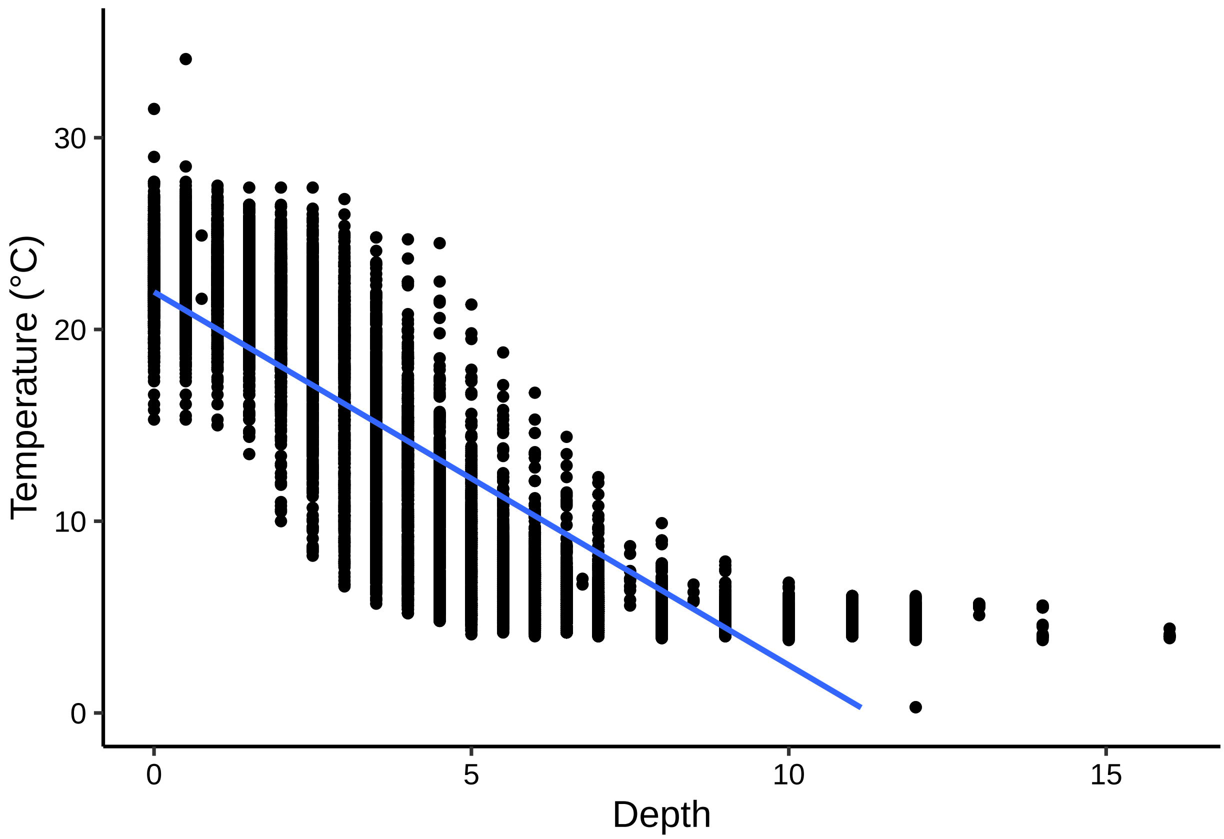
```
#4
NTL_processed <- NTL_raw %>% mutate(Month = month(sampledate)) %>%
  filter(Month == 7) %>% group_by(lakename,year4,daynum,depth) %>%
    summarise(mean_temp = mean(temperature_C)) %>% drop_na()
```

```
## `summarise()` has grouped output by 'lakename', 'year4', 'daynum'. You can
## override using the `.groups` argument.
```

```
#5
plot_temp_depth <- ggplot(data = NTL_processed,
                          aes(x = depth, y = mean_temp)) +
  ylim(0, 35) + geom_point() +
  geom_smooth(method = "lm", se = FALSE) + YH_Theme +
  labs(x = "Depth", y = "Temperature (°C)")
plot_temp_depth
```

```
## `geom_smooth()` using formula = 'y ~ x'

## Warning: Removed 24 rows containing missing values (`geom_smooth()`).
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

   Answer: For all lakes, as the depth of the lake goes up, the temperature decreases. The distribution of the points suggests that it is more likely to be polynomial curves.

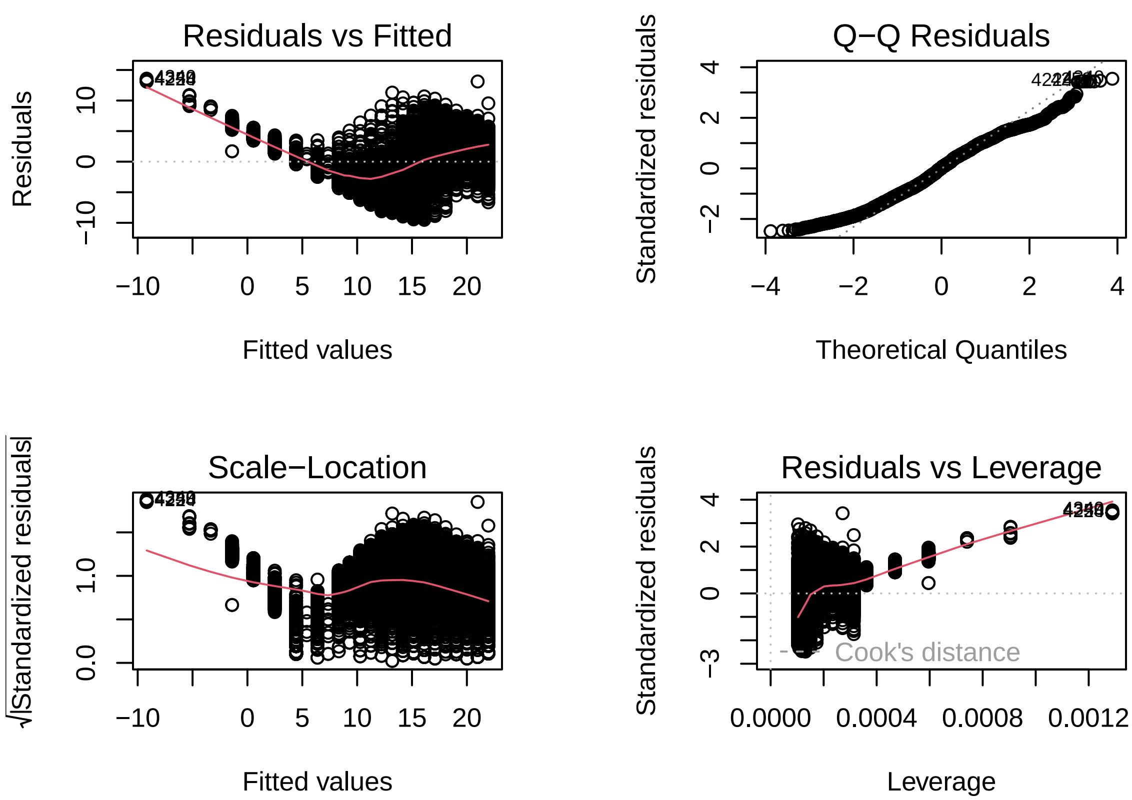
7. Perform a linear regression to test the relationship and display the results

```r
#7
linear_reg <- lm(data = NTL_processed,
  mean_temp ~ depth)
summary(linear_reg)
```

```
##
## Call:
## lm(formula = mean_temp ~ depth, data = NTL_processed)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.5173 -3.0192  0.0633  2.9365 13.5834
```

```
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 21.95597    0.06792   323.3   <2e-16 ***
## depth       -1.94621    0.01174  -165.8   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

```r
par(mfrow = c(2,2), mar=c(4,4,4,4))
plot(linear_reg)
```



```r
par(mfrow = c(1,1))
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

   Answer: The variability in temperature is highly explained by the changes in depth as the R squared value is equare to 0.7387 which is quite high and the degree of freedom is 9726 meaning that the pool of variables is quite big as well. We got a p value of <2e-16 which means the result is significant. For every 1 m changes in depth, temperature is predicted to change -1.94621.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```
#9
LTER_AIC <- lm(data = NTL_processed, mean_temp ~ year4 + daynum + depth)
step(LTER_AIC)
```

```
## Start:  AIC=26065.53
## mean_temp ~ year4 + daynum + depth
##
##          Df Sum of Sq    RSS   AIC
## <none>                141687 26066
## - year4   1       101 141788 26070
## - daynum  1      1237 142924 26148
## - depth   1    404475 546161 39189
```

```
##
## Call:
## lm(formula = mean_temp ~ year4 + daynum + depth, data = NTL_processed)
##
## Coefficients:
## (Intercept)        year4       daynum        depth
##    -8.57556      0.01134      0.03978     -1.94644
```

```
#10
LTER_model <- lm(data = NTL_processed, mean_temp ~ year4 + daynum + depth)
summary(LTER_model)
```

```
##
## Call:
## lm(formula = mean_temp ~ year4 + daynum + depth, data = NTL_processed)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715   -0.994  0.32044
## year4        0.011345   0.004299    2.639  0.00833 **
## daynum       0.039780   0.004317    9.215  < 2e-16 ***
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
```

```
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

    Answer: The final set of explanatory variables are all three variables (year4, daynum and depth). The R square of this model is 0.7412 meaning the observed variance is explained well using the three variables. This is an improvement over the model using only depth as the explanatory variable because the AIC value of this model (26066) is much lower than only depth (26148).

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```
#12
TempLake_Aov <- aov(data = NTL_processed, mean_temp ~ lakename)
summary(TempLake_Aov)
```

```
##               Df Sum Sq Mean Sq F value Pr(>F)
## lakename       8  21642  2705.2      50 <2e-16 ***
## Residuals   9719 525813    54.1
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
TempLake_Aov_linear <- lm(data = NTL_processed, mean_temp ~ lakename)
summary(TempLake_Aov_linear)
```

```
##
## Call:
## lm(formula = mean_temp ~ lakename, data = NTL_processed)
##

## Multiple R-squared:  0.03953,    Adjusted R-squared:  0.03874
## F-statistic:    50 on 8 and 9719 DF,  p-value: < 2.2e-16
```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

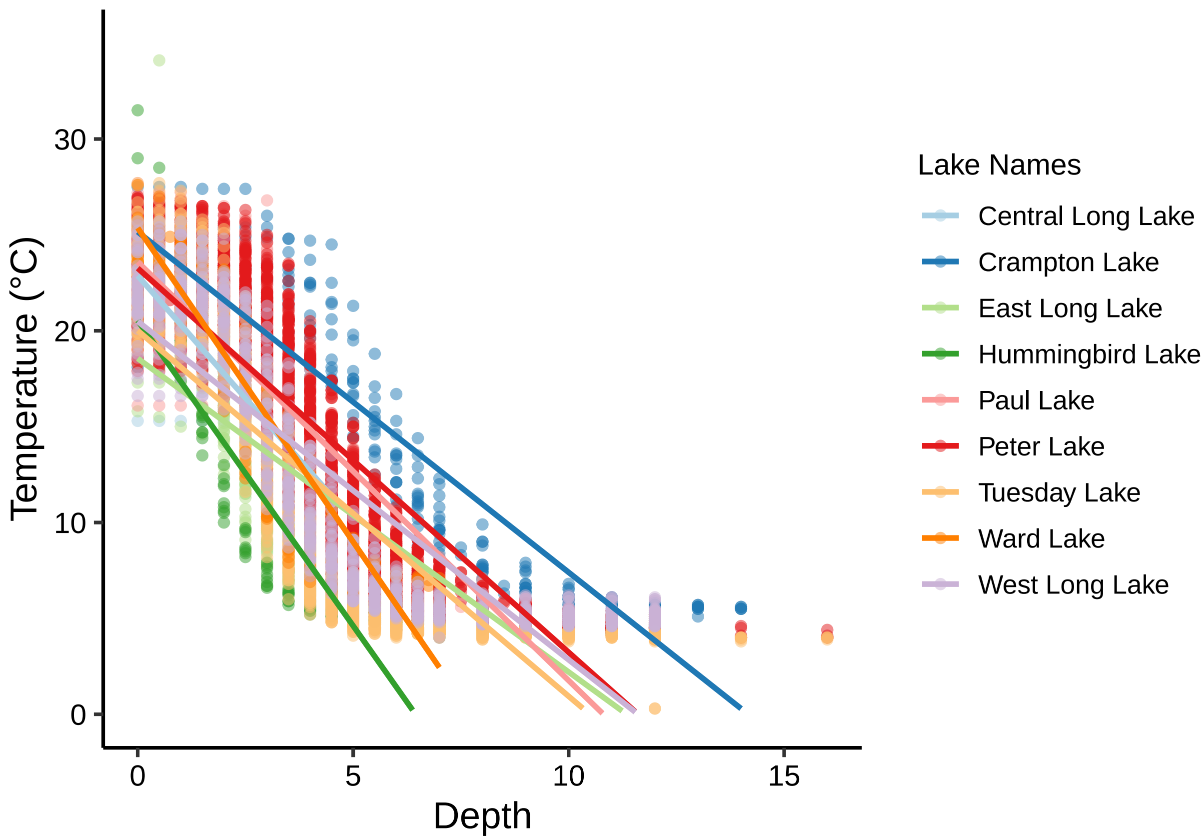
    Answer: There is a significant difference in mean temperature among lakes as the P value is less than 2.2e-16. The mean depth of Central Long Lake is significantly different to other lakes. Yet, the R square value is less than 0.04 meaning that other variables may also needed to explain the mean temperature changes.

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```
#14.
plot_temp_depth_lake <- ggplot(data = NTL_processed,
                          aes(x = depth, y = mean_temp, color = lakename)) +
  ylim(0, 35) + geom_point(alpha = 0.5) + scale_color_brewer(palette="Paired") +
  geom_smooth(method = "lm", se = FALSE) + YH_Theme +
  labs(x = "Depth", y = "Temperature (°C)", color = 'Lake Names')
plot_temp_depth_lake
```

```
## `geom_smooth()` using formula = 'y ~ x'
```

```
## Warning: Removed 73 rows containing missing values (`geom_smooth()`).
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```
#15
TukeyHSD(TempLake_Aov)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = mean_temp ~ lakename, data = NTL_processed)
##
## $lakename
##                                         diff        lwr        upr     p adj

16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: Paul Lake and Ward Lake have the same mean temperature as the p values of Paul Lake and Ward Lake compared to Peter Lake are 0.22 and 0.78 respectively which are not less than 0.05. There is not lake that is statistically distinct from all other lakes. These lakes have similar temperatures in pairs.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

> Answer: We can use two-tailed two-sample T-test.

18. Wrangle the July data to include only records for Crampton Lake and Ward Lake. Run the two-sample T-test on these data to determine whether their July temperature are same or different. What does the test say? Are the mean temperatures for the lakes equal? Does that match you answer for part 16?

```
NTL_CramWard <- NTL_processed %>%
  filter(lakename == 'Crampton Lake' | lakename == 'Ward Lake')
CramWard_Ttest <- t.test(NTL_CramWard$mean_temp ~ NTL_CramWard$lakename)
CramWard_Ttest
```

```
##
##  Welch Two Sample t-test
##
## data:  NTL_CramWard$mean_temp by NTL_CramWard$lakename
## t = 1.1181, df = 200.37, p-value = 0.2649
```

```
## alternative hypothesis: true difference in means between group Crampton Lake and group Ward Lake is n
## 95 percent confidence interval:
##  -0.6821129  2.4686451
## sample estimates:
## mean in group Crampton Lake     mean in group Ward Lake
##                    15.35189                    14.45862
```

Answer: The T test result shows that the lake temperatures in July for Crampton Lake and Ward Lake are not statistically significant (df = 200, P value = 0.2649). The means temperatures for the two lakes are not equal (Crampton: 15.35, Ward: 14.46) but they show no statistical significance. This result matches the result from Tukey's HSD test where also shows no significant difference (P value = 0.97)
